

SENSOR SPECIFICATIONS AND CROSS-SENSITIVITIES

Disclaimer: Technical Note TN-114 presents specifications, cross-sensitivities, and calibration information on select RAE Systems sensors. All specifications presented in this Technical Note reflect the performance of standalone sensors. For instrument specifications, please refer product datasheets and manuals.

Actual sensor characteristics may differ when the sensor is installed in different instruments. As sensor performance may change over time, specifications provided are for brand new sensors.

All specifications have been verified under the following environmental conditions:

Temperature: 68° F (20° C)

Relative humidity (non-condensing): 50%

Ambient pressure: 1 atm (1,013 mbar)

Please refer to the Glossary for specification definitions.

Specifications are subject to change without notice.

GLOSSARY

Range: The normal operating concentration of a sensor where the best linearity is found. Exceeding the normal operating range may result in erroneous readings and long recovery times, but should not permanently damage the sensor as long as the Max Overload is not exceeded.

Max Overload: The maximum exposure concentration. Exceeding this value will likely give erroneous readings and cause permanent damage to the sensor. This can be viewed as the sensor IDLH. Ammonia sensors often fail because they have been exposed to over 200 to 300 ppm (see Application Note AP-201).

Resolution: The least significant digit on the display or the minimum amount of chemical that the sensor can “see” (also known as: “Increment of measurement”).

Response Time (t_{90}): The time for a sensor to reach 90% of its final stable reading. Typically an exposure of twice the t_{90} time is required to get a stable reading. Response times of sensors and instruments may be different. The response time of instrument is dependent on sensor response time and test conditions like calibration gas flow rate, temperature etc.

Bias/Equilibration: Some electrochemical sensors (NO, NH₃) require a bias voltage to detect the gas, while most do not. Unbiased sensors may be shipped with a shorting pin across the electrodes to avoid an accidental bias. The pin should be removed before installation. Biased sensors require an equilibration time (also known as warm-up time) at least 6 hours after installation for the baseline to become stable enough to calibrate the sensor. Unbiased sensors require at least 10 minutes to stabilize. Once installed, any sensor bias stays on, even when the meter is off. Therefore, even biased sensors are ready for immediate use when the instrument is turned on again, and the equilibration time is needed only when first installed or if the battery becomes completely drained. The SensorRAE can be used to maintain bias on NO and other bias sensors, so long equilibration times can be avoided when installing such sensors into a multi-gas instrument.

Temperature Range: The normal operating temperature of the sensor. Sensors embody physico-chemical processes, which slow down when cooled and speed up when heated. Storing and using detectors outside in the winter may result in low readings if not recalibrated at the temperature of use. Storing detectors in hot cars in the summer may result in high readings and even dry out the sensors. Allowing a meter to return to normal operating temperature typically restores readings.

Pressure Range: The normal operating pressure of the sensor, typically atmospheric (14.7 psi) \pm 10%. Some sensors have a transient response to sudden pressure changes, which may cause them to go into alarm for a short time.

Operating Humidity: Normal operating humidity. Typically 15 to 90% relative humidity, “non-condensing.” Condensing humidity blocks the diffusion pathway, lowering the reading, and consistently high humidity can dilute the electrolyte and cause the cell to burst. Running or storing for extended periods in <10% RH gas can dry out the electrolyte and make the sensor inoperable.

Drift: The amount the sensor output may change over time, expressed in %.

Storage Life: The recommended maximum time a sensor should be stored in its original packaging before being installed in an instrument.

Storage Temperature: The recommended temperature to store sensors prior to use.

Operating Life: The expected useable life of the sensor after it is installed, as long as the “Storage Life” was not exceeded before installation.

GLOSSARY (continued)

Warranty: The time from shipment up to which RAE Systems will replace a sensor free of charge, or at reduced charge, in case of failure. The warranty period is generally equal to or less than the Operating Life. Thus, a sensor with a storage life of 6 months, operating life of 2 years and warranty of 2 years, stored for 6 months before installation, is expected to be useable for up to 2½ years from the date of manufacture, even though the warranty expires 1½ years after it is installed. The warranty expiration date is programmed into the sensor and displayed during start-up of most RAE Systems single- and multi-gas meters. Sensors can be used beyond the expiration date provided that the sensor is properly zeroed and calibrated and the resolution is acceptable for the purpose of the measurements. The resolution can be tested by simply observing the zero fluctuations, or more accurately by measuring the response in the instrument's Diagnostic Mode according to Technical Note TN-123. The expiration date is provided on the instrument only as a reminder to the user that the warranty period for that sensor is complete and that it may become necessary to replace the sensor in the near future. The sensor, however, can operate properly beyond the expiration date as long as it responds to the gas of interest and is tested as noted above.

Calibration Gas: Recommended calibration gas concentration. A lower concentration might not give a stable calibration, while higher concentrations might use up the sensor prematurely. However, if the sensor is operated outside the typical range, it is recommended to use a calibration gas as close as possible to the actual concentrations and gas type being measured. For example, an NO sensor used to measure in the 200 to 500 ppm range is preferably calibrated with 500 ppm NO, instead of 25 ppm. A CO sensor used to measure 100-1,000 ppm hydrogen should be calibrated with 1,000 ppm hydrogen gas.

Calibration Flow Rate: Recommended calibration gas flow rate.

Cross-Sensitivity: Every sensor has some cross-sensitivity, where the sensor responds to other gases that are not filtered out and can react on the electrode. It is very important to be aware of potentially cross-sensitive compounds when interpreting data.

SENSORS FOR COMBUSTIBLE GASES AND VAPORS

Combustible Gases and Vapors (LEL-1)

Sensor Type:	Protected catalytic bead
Gases Detected:	Most combustible gases and vapors
Range:	0 to 100%
LEL Resolution:	1% LEL
Response Time (t₉₀):	30 sec.
Bias/Equilibration:	No bias/10 min. after installation
Drift:	< 10% LEL/month
Storage Life:	2 years in sealed container
Operating Life:	2 years in air
Warranty:	2 years from date of shipment
Calibration Gas:	50% LEL of Methane, or 2.5% by volume, balance air
Part Number(s):	014-0101-000, 008-1171-001
Supported Instruments:	AreaRAE, MultiRAE IR, MultiRAE Plus, QRAE, RAEGuard, RAEGuard S

SENSORS FOR COMBUSTIBLE GASES AND VAPORS (continued)

Combustible Gases and Vapors (NDIR, % LEL Methane)

Sensor Type:	NDIR CH ₄ % LEL (Non-dispersive infrared)
Gases Detected:	Methane (CH ₄)
Range:	0 to 100% LEL (0-5.0% Vol. CH ₄)
LEL Resolution:	1% LEL
Response Time (t₉₀):	30 sec.
Bias/Equilibration:	1 min. after installation
Temperature Range:	-4° F to 122° F (-20° C to 50° C)
Pressure Range:	Atmospheric ±20%
Operating Humidity:	0 to 95% RH non-condensing
Drift:	< 5% signal/month
Storage Life:	2 years in sealed container
Storage Temperature:	-40° F to 122° F (-40° C to 50° C)
Operating Life:	2 years in air
Warranty:	1 year from date of shipment
Calibration Gas:	50% LEL of CH ₄ , balance air or N ₂
Part Number(s):	C03-0962-000
Supported Instruments:	MultiRAE Lite Pumped, MultiRAE, MultiRAE Pro

Combustible Gases and Vapors (NDIR, % Vol. Methane)

Sensor Type:	NDIR CH ₄ % LEL (Non-dispersive infrared)
Gases Detected:	Methane (CH ₄)
Range:	0 to 100% Vol. Methane (CH ₄)
Resolution:	0.1% Vol.
Response Time (t₉₀):	30 sec.
Bias/Equilibration:	1 min. after installation
Temperature Range:	-4° F to 122° F (-20° C to 50° C)
Pressure Range:	Atmospheric ±20%
Operating Humidity:	0 to 95% RH non-condensing
Drift:	< 5% signal/month
Storage Life:	2 years in sealed container
Storage Temperature:	-40° F to 122° F (-40° C to 50° C)
Operating Life:	2 years in air
Warranty:	1 year from date of shipment
Calibration Gas:	20% Vol. CH ₄ , balance air or N ₂
Part Number(s):	C03-0963-000
Supported Instruments:	MultiRAE Lite Pumped, MultiRAE, MultiRAE Pro

SENSORS FOR COMBUSTIBLE GASES AND VAPORS (continued)

Combustible Gases and Vapors (NDIR LEL SENSOR)

Sensor Type:	NDIR (Non-dispersive infrared)
Gases Detected:	CH ₄
Range:	0 to 100% LEL
Accuracy:	±0.1% Vol or ±5% of indication, whichever value is greater
Response Time (t₉₀):	30 sec.
Power Consumption:	<5 mW
Temperature Range:	-40° F to 140° F (-40° C to 60° C)
Pressure Range:	Atmospheric ±20%
Operating Humidity:	Up to 98% RH non-condensing
Storage Life:	24 months in sealed container
Storage Temperature:	-58° F to 140° F (-50° C to 60° C)
Operating Life:	24 months in air
Warranty:	12 months from date of shipment
Calibration Gas:	50% LEL of CH ₄ , balance air or N ₂
Part Number(s):	D01-3011-000
Supported Instruments:	MeshGuard LEL IR

OXYGEN SENSORS

Oxygen (O2)

Sensor Type:	Electrochemical
Range:	0 to 30% Vol.
Resolution:	0.1% Vol.
Response Time (t90):	15 sec.
Bias/Equilibration:	no bias/10 min. after installation
Temperature Range:	-4° F to 122° F (-20° C to 50° C)
Pressure Range:	Atmospheric ±10%
Operating Life:	2 years in air
Warranty:	2 years from date of shipment
Calibration Gas:	Ambient air (20.9% oxygen) or 18% O ₂
Zero Gas:	99.9% N ₂
Part Number(s):	170-0003-002, 008-1161-000, C03-0942-000
Supported Instruments:	AreaRAE, MultiRAE Family, MultiRAE IR, MultiRAE Plus, QRAE, QRAE Plus, RAEGuard EC, ToxiRAE Pro, VRAE, ToxiRAE II

Note: Measurements can be made in pure ethylene; recovery to ambient air may require a few hours.

Oxygen (O₂-LQ)

Sensor Type:	Electrochemical
Range:	0 to ~30%
Maximum overload:	90% O ₂
Resolution:	0.1% O ₂
Bias/Equilibration:	-600 mV
Temperature Range:	-4° F to 122° F (-20° C to 50° C)
Pressure Range:	Atmospheric ± 20%
Operating Humidity:	15 to 90% RH non-condensing
Storage Life:	6 months in sealed container
Storage Temperature:	32° F to 68° F (0° C to 20° C)
Expected Operating Life:	24 months in air
Warranty:	24 months from date of shipment
Calibration Gas:	Ambient air (20.9% oxygen) or 18% O ₂
Zero Gas:	99.9% N ₂
Part Number(s):	022-0902-000
Supported Instruments:	QRAE 3

Oxygen (O2) - SPE O2

Sensor Type:	Electrochemical (Solid Polymer Electrolyte)
Range:	0 to 30% Vol.
Resolution:	0.1% Vol.
Response Time (t90):	30 sec.
Bias/Equilibration:	-600 mV/30 min. after installation
Temperature Range:	-4° F to 122° F (-20° C to 50° C)
Pressure Range:	Atmospheric ±10%
Operating Humidity:	15 to 90% RH non-condensing
Drift:	< 2% signal/month
Storage Life:	6 months in sealed container
Storage Temperature:	32° F to 68° F (0° C to 20° C)
Operating Life:	2 years in air
Warranty:	2 years from date of shipment
Calibration Gas:	Ambient air (20.9% oxygen) or 18% O ₂
Zero Gas:	99.9% N ₂
Part Number(s):	022-0300-000
Supported Instruments:	QRAE II

Cross-Sensitivity Data, O₂ Sensor

Gas	Concentration	Response (% O ₂ equivalent)
CO ₂	2%	0 ppm
H ₂	1%	-2%

ELECTROCHEMICAL SENSORS FOR TOXIC GASES

Ammonia (NH₃)

Sensor Type:	Electrochemical
Range:	0 to 100 ppm
Resolution:	1 ppm.
Bias/Equilibration:	No bias/10 min. after installation
Temperature Range:	-4° F to 104° F (-20° C to 40° C)
Pressure Range:	Atmospheric ±10%
Operating Humidity:	15 to 90% RH non-condensing
Drift:	< 2% signal loss/month
Storage Life:	1 year in sealed container
Storage Temperature:	32° F to 68° F (0° C to 20° C)
Operating Life:	1 year in air
Warranty:	1 year from date of shipment
Calibration Gas:	50 ppm NH ₃ , balance N ₂
Zero Gas:	99.9% N ₂
Part Number(s):	170-0025-000, 008-1125-000, C03-0950-000
Supported Instruments:	AreaRAE, MeshGuard, MultiRAE Family, MultiRAE IR, MultiRAE Plus, QRAE Plus, RAEGuard EC, ToxiRAE II, ToxiRAE Pro, VRAE

Ammonia (NH₃)

Sensor Type:	Electrochemical
Range:	0 to 100 ppm
Resolution:	< 1 ppm (Electronics dependent)
Bias/Equilibration:	No bias/10 min. after installation
Temperature Range:	-4° F to 104° F (-20° C to 40° C)
Pressure Range:	Atmospheric ±10%
Operating Humidity:	15 to 90% RH non-condensing
Storage Life:	12 weeks in sealed container
Storage Temperature:	32° F to 68° F (0° C to 20° C)
Expected Operating Life:	>24 months in air
Warranty:	12 months from date of shipment
Calibration Gas:	50 ppm NH ₃ , balance nitrogen
Part Number(s):	170-0095-000
Supported Instruments:	QRAE 3

Cross-Sensitivity Data, NH₃ Sensor

Gas	Concentration	Response
Alcohols	1,000 ppm	0 ppm
CO	100 ppm	0 ppm
CO ₂	5,000 ppm	0 ppm
H ₂	10,000 ppm	0 ppm
H ₂ S	20 ppm	about 2 ppm ¹
Hydrocarbons	% range	0 ppm

1 - Short exposure of less than few minutes.

Cross-Sensitivity Data, NH₃ Sensor

Gas	Concentration	Response
Alcohols	1,000 ppm	0 ppm
CO	100 ppm	0 ppm
CO ₂	5,000 ppm	0* ppm
H ₂	10,000 ppm	0 ppm
H ₂ S	20 ppm	2** ppm
Hydrocarbons	% range	0 ppm

* - At higher carbon dioxide concentration (approx. > 5%) there can be a negative reading

** - Short gas exposure in minute range

Poisoning

Sensors are designed for operation in a wide range of environments and harsh conditions. However, it is important that exposure to high concentrations of solvent vapors is avoided, both during storage, fitting into instruments, and operation.

ELECTROCHEMICAL SENSORS FOR TOXIC GASES

Carbon Monoxide (CO)

Sensor Type:	Electrochemical
Range:	0 to 100 ppm
Max Overload:	1,500 ppm
Resolution:	1 ppm.
Bias/Equilibration:	No bias/10 min. after installation
Temperature Range:	-4° F to 122° F (-20° C to 50° C)
Pressure Range:	Atmospheric ±10%
Operating Humidity:	15 to 90% RH non-condensing
Drift:	< 2% signal/month
Storage Life:	6 months in sealed container
Storage Temperature:	32° F to 68° F (0° C to 20° C)
Operating Life:	2 years in air
Warranty:	2 years from date of shipment
Calibration Gas:	50 ppm CO, balance air
Part Number(s):	032-0100-000, 008-1112-000, C03-0906-000
Supported Instruments:	AreaRAE, MeshGuard, MultiRAE Family, MultiRAE IR, MultiRAE Plus, QRAE, QRAE Plus, RAEGuard, RAEGuard EC, RAEGuard S, ToxiRAE II, ToxiRAE Pro, VRAE

Poisoning

Sensors are designed for operation in a wide range of environments and harsh conditions. However, it is important that exposure to high concentrations of solvent vapors is avoided, both during storage, fitting into instruments, and operation.

ELECTROCHEMICAL SENSORS FOR TOXIC GASES (continued)

Chlorine Dioxide (ClO₂)

Sensor Type:	Electrochemical
Range:	0 to 1 ppm
Resolution:	0.01 ppm
Bias/Equilibration:	No bias/10 min. after installation
Temperature Range:	-4° F to 104° F (-20° C to 40° C)
Pressure Range:	Atmospheric ±10%
Operating Humidity:	5 to 95% RH non-condensing; no effect
Drift:	< 5% signal/6 months
Temperature Effect:	<0.02 ppm increase from -4° F to 104° F (-20° C to 40° C)
Storage Life:	6 months in sealed container
Storage Temperature:	32° F to 68° F (0° C to 20° C)
Operating Life:	2 years in air
Warranty:	1 year from date of shipment
Calibration Gas:	0.8 ppm ClO ₂ from gas generator or equivalent of 2 ppm Cl ₂ . Requires ClO ₂ gas generator, Cl ₂ surrogate gas, or quarterly factory calibration
Part Number(s):	170-0017-000, 008-1120-000, C03-0956-000
Supported Instruments:	ToxiRAE II, ToxiRAE Pro, MultiRAE Family, VRAE

Notes on ClO₂ Sensor Calibration and Operation:

ClO₂ sensors require a ClO₂ generator for calibration because this gas is too unstable to store in a cylinder. ClO₂ sensors may contain a built-in filter that removes Cl₂ and therefore using Cl₂ surrogate gas may not be possible when the filter is present. ClO₂ sensors without the filter may be calibrated using a Cl₂ surrogate gas. NO₂ is not a reliable surrogate whether filter is present or not. This sensor should not be exposed to H₂S, which plugs the on-board filter, unless the filter is absent.

1- Short exposure of <few minutes of <100 ppm, with filters.

2 - With onboard filters removed.

3 - **CAUTION!** Negative cross-sensitivities may cause the sensor to produce lower readings than the true concentration of gas in ambient air. ClO₂ sensors without the on-board filter have a negative cross-sensitivity to H₂S and other reducing gases, and may underestimate the ClO₂ concentration if H₂S is present.

Operating Life:	1 year in air
Warranty:	1 year from date of shipment
Calibration Gas:	9 ppm HCHO, or equivalent of 50 ppm CO, balance air
Part Number(s):	170-0078-000, C03-0982-000
Supported Instruments:	MultiRAE Family, ToxiRAE Pro

The Formaldehyde sensor has cross-sensitivity to other gases. Please refer to Technical Note 128 for list of compounds with positive and negative cross-sensitivities to HCHO sensor and the recommended method if use. Care should be taken to limit the use of HCHO sensor to the compounds discussed in TN128 with known cross-sensitivity behavior. Customers wishing to order instruments with any other sensor combination involving the HCHO sensor should contact RAE systems.

SENSOR CROSS-SENSITIVITIES

Electrochemical sensors, like many other sensors, are known to have cross-sensitivity to gases other than its target gas. Depending on the nature of the reaction in the sensor, the gas can either decrease the signal (negative cross-sensitivity) or increase the signal (positive cross-sensitivity). The cross sensitivity data listed here are based on at most a few batches of electrochemical sensors. The actual values may vary between batches because the cross sensitivity is not typically controlled during the manufacturing process.

When calibrating a multi-gas instrument that has two sensors which gases have significant cross-sensitivity, be sure to allow adequate time between calibrations to allow the sensors to clear.

When calibrating sensors with cross-sensitivities, calibrate the most cross-sensitive first, followed by the least cross-sensitive. Wait for both sensors to recover to zero, then expose both to gas again with most cross sensitive first and least cross sensitive second. For example, 50 ppm of NH₃ produces 0 ppm response on a Cl₂ sensor and 1 ppm of Cl₂ produces about -0.5 ppm of response on a NH₃ sensor. So calibrate the NH₃ sensor first with 50 ppm of NH₃. This should have no affect on the Cl₂ sensor. Then calibrate the Cl₂ sensor on 10 ppm Cl₂. This will send the NH₃ sensor negative for some period of time. After calibrating the Cl₂ sensor, return the meter to clean air and wait until the most cross-sensitive sensor (NH₃) fully recovers and/or stabilizes (if it stabilizes to a number other than zero then re-zero the meter). After both sensors return to zero apply calibration gas in the same order (NH₃ first then Cl₂) and note the sensor response. If both sensors are within 10% of the value on the gas cylinder then the calibration of the cross-sensitive sensors was successful.

The variety of sensor combinations, including corrosive, chemically active and highly adsorptive do not always address the proper calibration gas sequences and the calibration check tests that could potentially lead to actual gases. This can create misleading data in the field and cause possible threats to workers/responders' personal health and safety. Calibration sequence of such sensors in different combinations were experimentally confirmed in TN-203 for the new MultiRAE family instruments.

Use extreme caution with mixtures of gases!

The following **table and data** are based on % cross-sensitivity to a single gas. Mixtures of the gases were not tested and results with mixed gases are unpredictable.

The tables on the following pages show cross-sensitivities of various sensors to different gases.

Item	Cross-Sensitivity Codes for Select Sensors Used in RAE Systems Monitors	
Positive cross-sensitivity	•	Slight positive cross-sensitivity (≤10% reading of the specified gas)
	••	Moderate positive cross-sensitivity (10 to 50% reading of the specified gas)
	•••	High positive cross-sensitivity (>50% reading of the specified gas)
Negative cross-sensitivity	†	Slight negative cross-sensitivity (-10% to 0 reading of the specified gas)
	††	Moderate negative cross-sensitivity (-10% to -50% reading of the specified gas)
	†††	High negative cross-sensitivity (<-50% reading of the specified gas)
No data	Blank	

From the safety standpoint, a negative cross-sensitivity may present a higher risk than a positive one, as it will diminish the response to the target gas and so prevent an alarm.

1* HCN sensor filter can withstand up to 120 ppm*hours H₂S exposure, though t90 may increase to about 100s for the worse case.

2* SO₂ gas may have a cumulative impact on the HCN sensor filter, which capacity against SO₂ is 100 ppm*hours.

3* Cl₂ gas may have a cumulative impact on the HCN sensor filter, which capacity against Cl₂ is 100 ppm*hours.

4* PH₃ sensor filter capacity is 200ppm*hours against H₂S, SO₂, and Cl₂ gases.

EXTENDED CALIBRATION AND SOAK TIMES

Most RAE systems instruments (MultiRAE family, ToxiRAE Pro, etc.) incorporating electrochemical or NDIR sensors should follow the instrument calibration time and soak time as outlined in the table below. Teflon tubing (1ft is recommended) should be used for calibration and verification testing for reactive gases.

For more comprehensive soak and calibration time for the MultiRAE instruments family, see TN-203

Automatic vs. Manual Calibration:

When used in automatic calibration mode (with AutoRAE2), soak time is required to ensure proper gas concentration delivery during calibration. The soak time can be set through ProRAE studio II using the guideline in the table below.

When used in manual calibration mode, instrument calibration time is sufficient.

Guideline for Manual Calibration of Classic Instruments:

Some classic instruments (AreaRAE, MultiRAE Plus, QRAE Plus, etc.) have a fixed calibration time (typically 60 sec.) programmed into the instrument. When doing manual calibration it is recommended to extend the amount of time the sensor is exposed to gas to match values summarized in the above table. As a reminder newer instruments like the MultiRAE and ToxiRAE Pro family automatically adjust the programmed calibration time in the instrument to those listed in the table so there is no need to apply gas in advance of starting the countdown sequence.

For example, when performing calibration of the MultiRAE Plus for Cl₂, apply gas for 140 seconds prior to pressing the [Y/+] to start the programmed calibration time countdown of 60 seconds. In this case the sensor is exposed to Cl₂ gas for a total of 200 seconds during the calibration process ensuring an accurate calibration.
